

Is your Patient 'FIT and SAFE'?

A quality improvement project on the discharge of asthma patients from the emergency department

Dr F Waqas, Ms. J Cousins, Dr C Wittstock, Dr S Butt, Dr W Niven

Background

The Royal College of Emergency Medicine (RCEM) has set 6 standards of good practice that should be met prior to discharge of a patient with an acute exacerbation of asthma. These are:

- Consideration of psychosocial factors
- · Checking the inhaler type and technique
- Written advice
- Correct prescription of prednisolone
- Advice to see GP within 2 working days

At Homerton University Hospital, poor performance against these standards had been highlighted by the Care Quality Commission (CQC) and by a 3-month audit into local practice from January to April 2019

Aim

80% of patients discharged from the Emergency Department will receive the RCEM standards of asthma care by 31 July 2019.

Methodology

This project used the IHI's Model for Improvement's plan, do, study, act (PDSA) methodology to accomplish the aim. A multi-disciplinary team reviewed the attendances of 5 adult patients (>16 years) who were discharged following an asthma exacerbation per week. Data was entered weekly and 6 PDSA cycles were carried out.

PDSA 1

A discharge mnemonic for asthma patients (see box) was derived and introduced via email to all nurses and doctors

PDSA 2

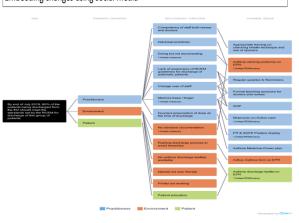

Tailored sessions for doctors and nurses were carried out and important messages stressed at daily afternoon handover for one week.

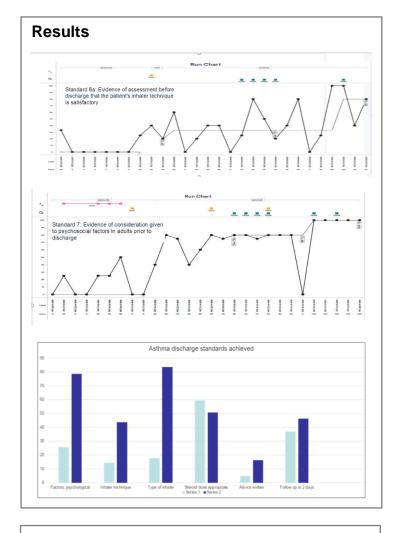

PDSA 3

An electronic, asthma clerking pro-forma was created in accordance with best practice guidelines

PDSA 4

Embedding changes using social media

Conclusion

The project is ongoing, but the results demonstrate a significant progress towards our stated aim 12 weeks after starting. The next challenge of this project is to maintain performance. To this end, we have created a core of permanent staff including an ED consultant and senior nurse practitioner to ensure sustainability.

Reflections

The key to success in this project was ensuring strict terms of reference around addressing the quality of asthma discharge care. In addition, early planning with a multidisciplinary team meant that there were drastic improvements to care in a relatively short period of time. Sustaining quality initiatives in a health system where care is provided by doctors who change every 6-12 months is challenging. However, by implementing and popularising an easy to use mnemonic (FIT & SAFE) and ensuring senior leadership on the project going forward, we believe that incremental improvements will continue towards realising the original aim.
